FOREIGN LANGUAGES

In the event that you are reading this manual in a language other than the English language, you acknowledge and agree that the English language version shall prevail in case of inconsistency or contradiction in interpretation or translation.

→ THE SYMBOLS USED IN THIS DOCUMENT REFER TO THE FOLLOWING:

WARNING

Contains instructions aimed at preventing bodily injury or direct damage to the crops, the FertiKit™ system and/or the infrastructure.

CAUTION

Contains instructions aimed at preventing unwanted system operation, installation or conditions that, if not followed, might void the warranty.

ATTENTION

Contains instructions aimed at enhancing the efficiency of usage of the instructions in the manual.

NOTE

Contains instructions aimed at emphasizing certain aspect of the operation of the system or installation.

ACID HAZARD

Contains instructions aimed at preventing bodily injury or direct damage to the crops and/or the irrigation system in the presence of acid.

ELECTRICAL HAZARD

Contains instructions aimed at preventing bodily injury or direct damage to the FertiKit[™] 5G and/or the infrastructure in the presence of electricity.

SAFETY FOOTWEAR

Contains instructions aimed at preventing foot injury.

PROTECTIVE EQUIPMENT

Contains instructions aimed at preventing damage to health or bodily injury in the presence of nutrients, acid or chemicals.

EXAMPLE

Provides an example to clarify the operation of the settings, method of operation or installation. The values used in the examples are hypothetical. Do not apply these values to your own situation.

TIP

Provides clarification, tips or useful information.

SAFETY

Read the Safety instructions chapter before using, maintaining or troubleshooting the FertiKit™ 5G.

→ SAFETY INSTRUCTIONS

- All safety regulations must be applied.
- Installation should be performed by authorized technicians only.
- Protection provided by the equipment can be impaired if the equipment is used in a manner other than that specified by the manufacturer.

WARNING

- Ensure that the installation is carried out in a manner that prevents leaks from the FertiKit[™],
 the fertilizer/acid tanks and lines, the peripherals and the accessories (contaminating the
 environment, soil or ambient area).
- Measures must be taken to prevent fertilizer infiltration of the water source, to avoid water pollution.

ELECTRICAL HAZARD

- Electrical installation should be performed by an authorized electrician only.
- The electrical installation must comply with the local safety standards and regulations.

CAUTION

In agricultural environment - always wear protective footwear.

CAUTION

When opening or closing any manual valve, always do it gradually, to prevent damage to the system by water hammer.

NOTE

The maximum sound level produced by the equipment does not exceed 70dB.

→ WHEN USING ACID/CHEMICALS

ACID HAZARD

When using acid - always observe the acid manufacturer's safety instructions.

CAUTION

Always use protective equipment, gloves and goggles when handling fertilizers, acid and other chemicals!

CAUTION

There are fertilizer combinations that at high concentration might induce crystallization in the FertiKit's lower manifold and cause clogging of the pipes.

Fertilizer combinations prone to induce crystallization:

Calcium Nitrate	+	Ammonium Sulfate	⇒	Calcium Sulfate
Calcium Nitrate	+	Potassium Sulfate	⇒	Calcium Sulfate
MKP	+	Calcium Nitrate	⇒	Calcium Phosphate
MAP	+	Calcium Nitrate	⇒	Calcium Phosphate
Phosphoric acid	+	Calcium Nitrate	⇒	Calcium Phosphate

When injecting these fertilizer combinations:

- Make sure to dilute each fertilizers to the allowed concentration in the fertilizer tank prior to injection through the FertiKit™
- Imediately after each injection of any of the fertilizer combination above, flush the FertiKit[™] with clean water for at least 2 minutes.

In case of doubt regarding the use of any combination of fertilizers, contact your Netafim $^{\text{TM}}$ local representative.

ATTENTION

When dosing acid, use a dosing channel fitted with the appropriate components according to the type and concentration of acid used*

		For pH correction				For maintenance of drippers			
Type of dosing channel	Diaphragm and O-rings	Nitric acid (HNO3)	Phosphoric acid (H ₃ PO ₄)	Sulfuric acid (H ₂ SO ₄)	Potassium hydroxide (KOH)	Acetic acid (CH ₃ COOH)	Hydrochloric (HCl)	Hydrogen peroxide (H ₂ O ₂)	Chlorine (as hypochloride)
For diluted acid	EPDM	<3%	<85%	<30%	<35%	<30%	<10%	<30%	<1%
For concentrated acid	Viton	<40%	<85%	<90%	<10%	<5%	<33%	<50%	<10%

[%] is by weight at 21°C (70°F)

^{*}The table indicates the resistance of the dosing channel components to acid, and is not a recommendation to use the acids mentioned.

WARNING

- Exceeding the recommended acid concentrations will damage the dosing channels.
- Substances such as chemicals for pest/disease control might be corrosive and damage the FertiKit™ 5G. When using any substance other than fertilizers or acids not exceeding the concentrations in the table above, always observe the manufacturer's instructions for corrosivity.
 In case of any doubt, contact your Netafim™ local representative.

DESCRIPTION

→ DESCRIPTION

The FertiKitTM 5G is a fully configurable fertilizer/acid dosing unit - a highly cost-effective solution for precise NutrigationTM.

Based on a standard platform, the FertiKit[™] offers 8 different operation modes, selectable according to the site conditions, in order to maximize usage of available water flow rate and pressure on the main irrigation line, ensuring the highest efficiency with minimum investment.

The FertiKit[™] can accommodate a variety of dosing channels, dosing boosters, controllers, peripherals and accessories to meet a vast range of applications and infrastructure constraints.

Capacity range

The FertiKit™ ensures a satisfactory mixture in an extremely vast range of flow capacities.

- It will accommodate a 0.1 Ha (0.25 Acres) nursery or a 400 Ha (1000 Acres) sugar cane plantation.
- Main line pressure range: up to 8.5 bars (123.0 PSI).
- Main line flow rate range: from 1.0 to 700.0 m³/h (from 4.4 to 3000.0 GPM).

→ ADVANTAGES

- A modular Nutrigation[™] system for soil or substrate applications with minimum investment
- Efficient usage of water, fertilizers and energy
- Unrivaled range of irrigation water capacities
- Designed for any application where quantitative or proportional Nutrigation™ is required
- Highly profitable price/performance ratio
- Venturi operating principle no moving parts
- Fits easily into any existing irrigation system
- Precise Nutrigation[™] based on high-accuracy dosing channels
- Quick action dosing valves
- Available with up to 6 fertilizer/acid dosing channels
- Nutrigation[™] recipes can be changed quickly and efficiently
- Can be operated manually or fully computerized
- GrowSphere MAX and other controllers can be assembled on the FertiKit[™] for advanced Nutrigation[™] control
- Features lightning protection RPLP
- A wide variety of accessories and peripherals can be integrated into the FertiKit[™] to enhance its functions
- High-quality components and PVC pipe work
- Aluminum, corrosion-resistant frame with adjustable legs
- Easy to install and to maintain
- Made by Netafim™

→ BASIC FUNCTIONS

The FertiKit™ supports the following Nutrigation™ functions:

- Fully controlled dosing and mixing of fertilizers/acid with source water into a homogenous nutrient solution.
- EC/pH correction of the nutrient solution.
- Water pre-treatment

→ OPERATING PRINCIPLE

The FertiKit[™] doses the various fertilizers and acid into a homogeneous solution and injects it into the irrigation water main line. The suction of the fertilizers and acid in the dosing channels is based on the Venturi principle. This requires a pressure differential - available on the main line or supplied by the main line pump or the FertiKit's dosing booster.

→ MODULARITY

The modular FertiKit[™] 5G concept is based upon an array of interchangeable components that enables rapid assembly of a wide range of configurations.

Each FertiKit™ is delivered according to the precise customer's order, either fully factory assembled or assembled by the local dealer.

The dealer stocks the assortment of the FertiKit[™] interchangeable components.

This concept enables the dealer to assemble any specific FertiKit[™] according to the customer's order, saving the need to stock a large quantity of fully assembled FertiKit[™] units of various common configurations. The modular FertiKit[™] 5G concept ensures prompt delivery schedules without delays!

Stock selection option

Enables the dosing of multiple fertilizers through a single dosing channel (in cases where simultaneous dosing is not required). Suits all modes of FertiKit™. Available in a wide variety of configurations, from a single dosing channel with 2 fertilizers to as many dosing channels and fertilizers as required. There are fertilizer combinations that at high concentration might induce crystallization in the FertiKit's lower manifold and cause clogging of the pipes (see CAUTION Fertilizer combinations prone to induce crystallization, on page 6).

→ COMPATIBILITY

The FertiKit[™] 5G can be incorporated in an existing or a planned project; in either case it offers a highly cost-effective solution for Nutrigation[™] by taking maximum advantage of the infrastructure conditions. Any available pressure surplus can be used for the FertiKit's operation. In order to configure the most cost-effective FertiKit[™], making the maximum use of available pressure.

ATTENTION

Calculations are either in metric or in US units - consistency in the type of units used is essential.

→ SERVICE

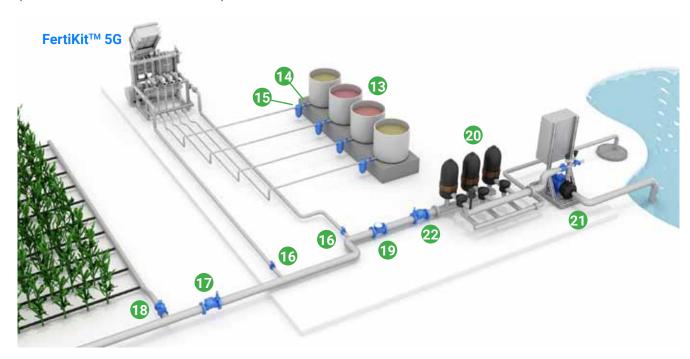

Servicing the FertiKit $^{\text{TM}}$ 5G is a prompt and simple process. The dealer keeps a small quantity of interchangeable components on hand, for replacement on site within a few minutes.

→ MAINTENANCE

To prevent failures and extend the life cycle of the FertiKitTM, regular maintenance must be carried out by the user, such as periodic rinsing of filters and calibration of the EC/pH sensors. For full maintenance instructions, see Maintenance (page 19).

→ TYPICAL INSTALLATION OVERVIEW

The drawing below represents the typical infrastructure suitable for the PL mode. Each one of the FertiKitTM 5G 8 modes fits a different infrastructure configuration. (see The Fertikit's 8 Modes below).

→ MAIN PARTS OF THE FERTIKIT™ 5G AND ITS INFRASTRUCTURE

The list below presents the main parts of the FertiKitTM and the parts of the infrastructure required for the operation of the FertiKitTM 8 various modes.

- 1 Dosing channel + Venturi
- 2 Upper manifold pressure gauge
- 3 Lower manifold pressure gauge
- 4 Sampling outlet
- Controller
- 6 EC sensor
- 7 pH sensor
- 8 EC/pH transmitter
- 9 Dosing booster
- 10 Dosing booster switchbox

- 111 Check valve
- 12 Pressure switch
- 13 Fertilizer/acid stock tank
- 14 Manual valve (fertilizer)
- 15 Fertilizer/acid filter
- 16 Manual valve (isolation)
- Main line pressure sustaining valve (PSV)
- 18 Irrigation valve
- 19 Water meter
- 20 Main line filter

- 21 Main line pump
- 22 Main line pressure reducing valve (PRV)
- 23 Sampling outlet
- Saddle fitting
- 25 Command tube
- 26 Pressure sustaining valve (PSV)
- 27 Pressure reducing valve (PRV)
- 28 Water meter
- 29 Air release valve

Legend:

- Supplied (part of the FertiKit™),
- Not supplied (part of infrastructure),
- Optional in most modes (standard in MX mode).

→ THE FERTIKIT'S 8 MODES

Each one of the FertiKit™ 5G 8 modes depicted on the following pages fits a specific infrastructure configuration.

→ PL MODES (PL/PS/PR/RL)

Operating principle: The pressure differential required to generate fertilizer suction via the Venturis is produced by a booster pump integrated in the FertiKit TM .

These modes of operation, where the lower manifold is under low pressure (around 0 bars/PSI), permits the use of high-efficiency Venturis with high suction capacity and low motive flow consumption.

Flow rate: 20 - 700 m³/h (85 - 3000 GPM)

Suitable for main line pressure:

- **PL:** 2.5 6.5 bars (36 94 PSI)
- **PR with PRV 27:** 6.5 8.5 bars (94 123 PSI)
- PS with PSV 26: Based on cavitation risk (see page 19)
- RL with PRV 27 and PSV 26: 2.5 8.5 bars (36 123 PSI)

Dosing channels:

Accommodates a wide variety of dosing channels for fertilizer and concentrated/diluted acid:

50Hz: Up to 6 x 50 - 1000 l/h (13 - 265 GPH)

• **60Hz:** Up to 5 x 50 - 1000 l/h (13 - 265 GPH) (Includes compensation channel)

• **Optional** - Concentrated acid channel, 50 l/h (13 GPH)

NOTE

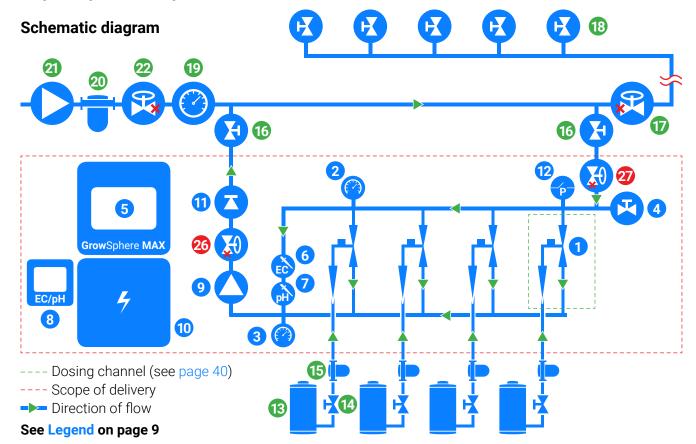

In 60Hz units only, add 3 m³/h (13.2 GPM) for the consumption of the compensation channel.

Total fertilizer/acid suction capacity:

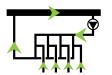

• **50Hz:** Up to 6000 I/h (1585 GPH).

• **60Hz:** Up to 5000 I/h (1320 GPH).

Controller: GrowSphere™ MAX (Other controllers or manual system without controller - optional)

→ PB MODE

Operating principle: The pressure differential required to generate fertilizer suction via the Venturis is produced by a booster pump integrated in the FertiKit $^{\text{TM}}$.

This mode of operation, where the smaller system pump

is installed upstream from the Venturis, permits the use of a small booster pump, reducing the investment required and saving energy. This mode is suitable for relatively low flow rates and pressures.

Flow rate: 5 - 70 m³/h (22 - 300 GPM)

Suitable for main line pressure: 1.5 - 2.5 bars (22 - 36 PSI)

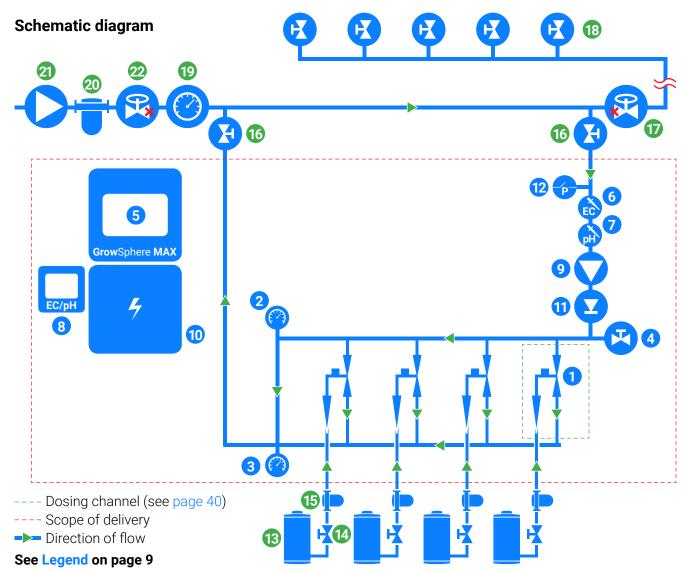

Dosing channels:

Accommodates a wide variety of dosing channels for fertilizer and concentrated/diluted acid:

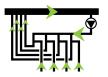

- Up to 4 x 50 370 l/h (13 100 GPH)
- Optional Concentrated acid channel, 50 l/h (13 GPH)

Total fertilizer/acid suction capacity: up to 1480 l/h (390 GPH)

Controller: GrowSphere™ MAX (Other controllers or manual system without controller - optional)

→ SP MODE

Operating principle: The pressure differential required to generate fertilizer suction via the Venturis is produced by a booster pump integrated in the FertiKit $^{\text{TM}}$.

This mode of operation, where the system pump is

installed upstream from the Venturis, permits the use of a smaller booster pump, reducing the investment required and saving energy. This mode is suitable for relatively low flow rates and pressures.

For applications that use very high concentration fertilizers and acid.

The solution has to be mixed in the main line.

SP mode is not equipped with a lower manifold.

(Can be supplied to the USA market with all parts inch-based to facilitate replacement using locally available spare parts).

Flow rate: 5 - 250 m³/h (22 - 1100 GPM)

Suitable for main line pressure: 1.5 - 3.5 bars (22 – 51 PSI)

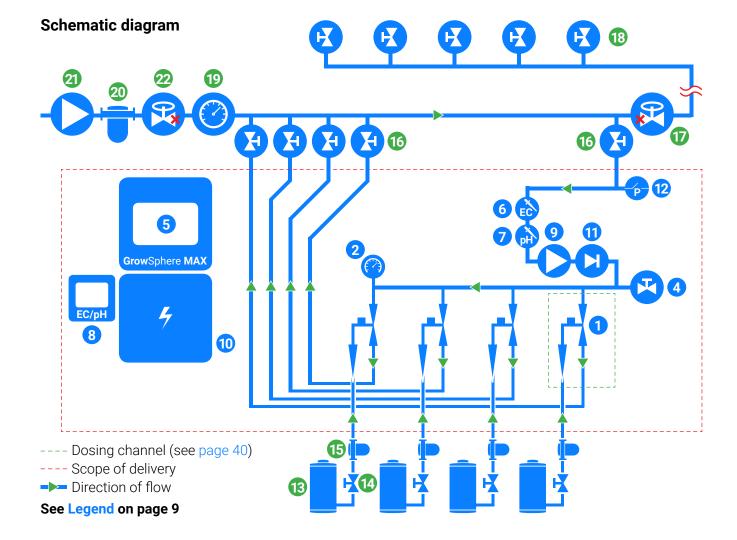

Dosing channels:

Accommodates a wide variety of dosing channels for fertilizer and concentrated/diluted acid:

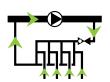

- Up to 4 x 50 370 l/h (13 100 GPH)
- Optional Concentrated acid channel, 50 l/h (13 GPH)

Total fertilizer/acid suction capacity: Up to 1480 I/h (390 GPH)

Controller: GrowSphere[™] MAX (Other controllers or manual system without controller - optional)

→ MS MODE (MS/RS)

Operating principle: For systems operating under negative suction - from a reservoir or a tank [max. height: 6 meters (20 feet)] Utilizes the main line pump pressure. Saves the need for a dosing booster.

Flow rate: 20 - 700 m³/h (85 - 3000 GPM)

Suitable for main line pressure:

- **Upstream from the pump:** -0.3 +0.6 bar (-4 +9 PSI)
- At the outlet of the pump: 2.5 6.5 bars (36 94 PSI)
- **RS with PRV:** 6.5 8.5 bars (94 123 PSI) at the FertiKit™ inlet.

Additional conditions:

- Requires the connection of the FertiKit's outlet to the main line upstream from the pump.
- The main line pump should be able to deliver the flow rate required for the operation of the FertiKit™ + the field consumption.

Dosing channels:

Accommodates a wide variety of dosing channels for fertilizer and concentrated/diluted acid:

- **50Hz:** Up to 6 x 50 1000 l/h (13 265 GPH)
- Optional Concentrated acid channel, 50 l/h (13 GPH)

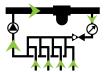

Total fertilizer/acid suction capacity: up to 6000 I/h (1585 GPH)

Controller: GrowSphere™ MAX (Other controllers or manual system without controller - optional)

EC/pH: Single, monitoring and control

Schematic diagram -0.3 - +0.6 bar (-4 - +9 PSI) -0.4 - +0.6 bar (-4 - +9 PSI) -0.5 - -0.5 bar (-4 - +9 PSI) -0.5 - -0.5

→ IL MODE

Operating principle: The pressure differential required to generate fertilizer suction via the Venturis is produced by a booster pump integrated in the FertiKit $^{\text{TM}}$.

In this mode of operation, the lower manifold is at low

pressure (around 0 bar/psi) this allows the use of high-efficiency Venturis with high suction capacity and low motive flow consumption. Since all the main line water flows through the system, slight pressure losses at the FettiKit™ outlet should be considered (see the table below).

Flow rate: 3 - 18 m³/h (13 - 85 GPM)

Suitable for main line pressure: 2.5 - 5.5 bars (36 - 79 PSI)

Dosing channels:

Accommodates a wide variety of dosing channels for fertilizer and concentrated/diluted acid:

- **50Hz:** Up to 6 x 50 600 l/h (13 156 GPH)
- **60Hz:** Up to 3 x 50 600 l/h (13 156 GPH) Includes compensation channel.
- **Optional** Concentrated acid channel, 50 l/h (13 GPH)

Total fertilizer/acid suction capacity:

50Hz: Up to 3600 l/h (950 GPH)60Hz: Up to 1800 l/h (475 GPH)

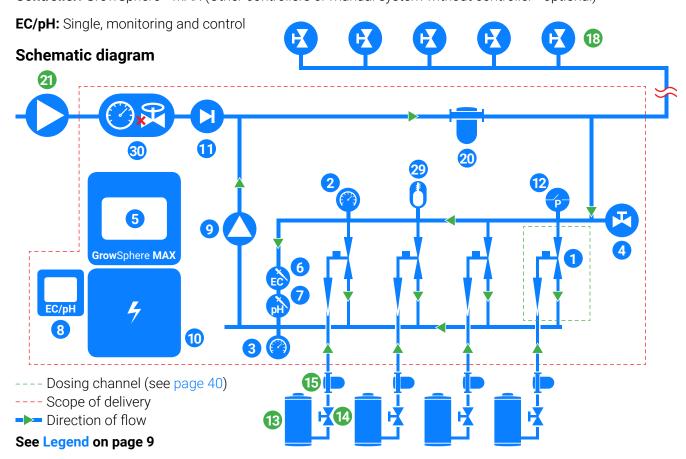

NOTE

In 60Hz units only, add 3 m³/h (13.2 GPM) for the consumption of the compensation channel.

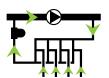

Controller: GrowSphere[™] MAX (Other controllers or manual system without controller - optional)

Flow rate m³/h (GPM)	Pressure loss bar (PSI)
5 (22)	0.1 (1.45)
10 (44)	0.3 (4.35)
15 (66)	0.6 (9.55)

→ ST MODE

Operating principle: For systems operating at low pressure :

from an on-ground reservoir or a tank [max. height: 6 meters (20 feet)]

The dosing booster pump also serves as main line pump.

Supplied with a manual or a semi-automatic filter.

Flow rate: 1 - 16 m³/h (4.4 - 70 GPM)

Suitable for main line pressure:

• **Upstream from the pump:** -0.3 - +0.6 bar (-4 - +9 PSI)

• At the outlet of the pump: 2.0 - 5.5 bars (29 - 80 PSI)

Additional conditions:

When selecting a dosing booster, consider the required field flow + the TC (TC - see page 18, Dosing booster curves - see page 34-35).

Dosing channels:

Accommodates a wide variety of dosing channels for fertilizer and concentrated/diluted acid:

- Up to 6 x 50 600 l/h (13 156 GPH)
- **Optional** Concentrated acid channel, 50 l/h (13 GPH)

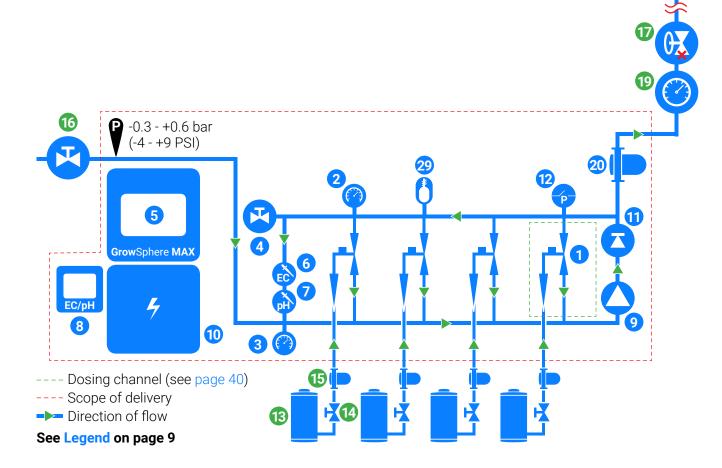

Total fertilizer/acid suction capacity: Up to 3600 l/h (950 GPH)

Controller: GrowSphere™ MAX (Other controllers or manual system without controller - optional)

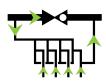

EC/pH: Single, monitoring and control

Schematic diagram

→ PD MODE

Operating principle:

Utilizes the main line pressure or gravity feed. Saves the need for a dosing booster. Also suitable for applications where there is no electricity on the site (contact Netafim TM).

Flow rate: 10 - 200 m³/h (44 - 880 GPM)

Suitable for main line pressure: 4.5 - 8.0 Bars (65 - 116 PSI)

Additional conditions:

For the dosing channels to provide proper suction, the pressure downstream from the PRV should be at least 50% of the the pressure upstream from the PRV (The eficiency of the Venturis decreases if this condition is not met). In addition the system must supply suficient pressure for the field demand.

Dosing channels:

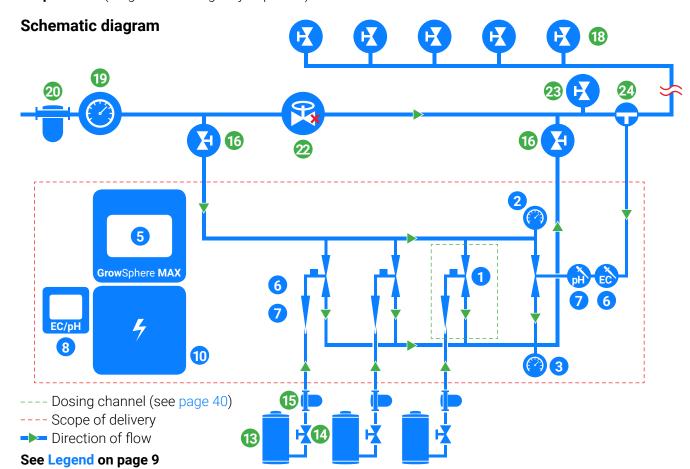

Accommodates a wide variety of dosing channels for fertilizer and concentrated/diluted acid:

- Up to 4* x 50 370 l/h (13 100 GPH)
 *If EC/pH is installed it occupies the location of one dosing channel (power required).
- **Optional** Concentrated acid channel, 50 l/h (13 GPH)

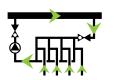

Total fertilizer/acid suction capacity: up to 1480 l/h (390 GPH)

Controller: GrowSphere™ MAX (Other controllers or manual system without controller - optional)

EC/pH: None (Single monitoring only - optional)

→ MX MODE

Operating principle: The pressure differential required to generate fertilizer suction via the Venturis is produced by a booster pump integrated in the FertiKit $^{\text{TM}}$.

This mode of operation, where the lower manifold

is under low pressure (around 0 bars/PSI), permits the use of high-efficiency Venturis with high suction capacity and low motive flow consumption. PRV and PSV as standard.

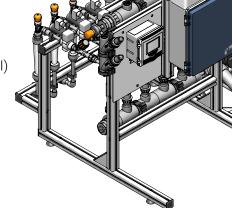

Flow rate: 20 - 700 m³/h (85 - 3000 GPM)

Suitable for main line pressure: 2.5 - 8.5 bars (36 - 123 PSI)

Dosing channels:

Accommodates a wide variety of dosing channels for fertilizer and concentrated/diluted acid:

 Up to 5 x 50 - 1000 l/h (13 - 265 GPH) (Includes compensation channel)

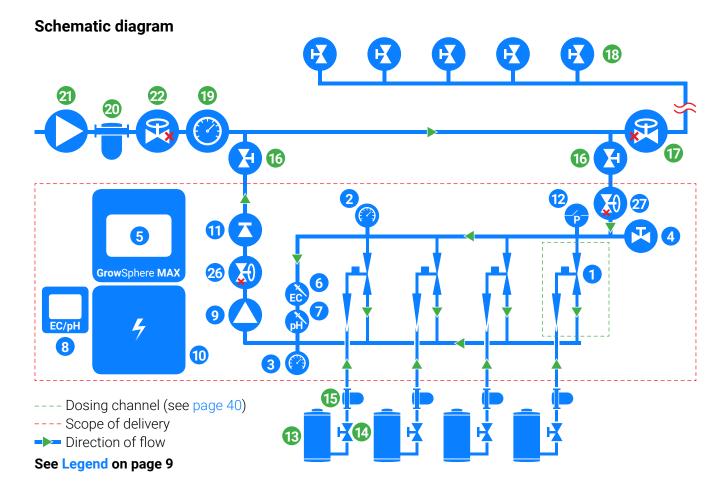

NOTE

Add 3 m³/h (13.2 GPM) for the consumption of the compensation channel.

• Optional - Concentrated acid channel, 50 l/h (13 GPH)

Total fertilizer/acid suction capacity: Up to 5000 I/h (1320 GPH).

Controller: GrowSphere™ MAX (Other controllers or manual system without controller - optional)

OPERATION AND MAINTENANCE

→ OPERATION

The routine operation of the FertiKit TM is almost totally automatic, controlled by the controller (for the operation of the controller, see the Controller Manual).

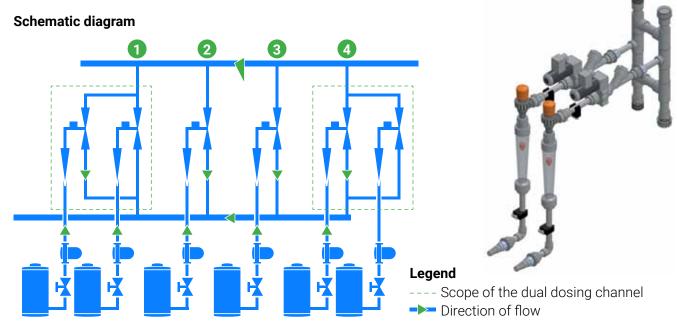

All you need is to make sure that:

- Electricity is supplied to the FertiKit™.
- Adequate quality water at the appropriate flow rate and pressure is supplied at the inlet of the FertiKit[™] (see the FertiKit[™] Hydraulic Conditions Checklist, page 45).
- Properly dissolved fertilizers, according to the agronomist's instructions, are constantly present in the stock tanks.
- If acid is used it is constantly present in the acid stock tank and does not exceed the recommended concentration (see ATTENTION, page 6).

Dual dosing channel

If more than 4 dosing channels are required (up to 6), the dual dosing channel option can be used.

- Up to 2 dual dosing channels can be installed on the FertiKit™ 5G, at the No.1 and No. 4 manifold positions.
- The dual dosing channel option is applicable with 50 l/h (13 GPH), 600 l/h (158 GPH) and 1000 l/h (265 GPH) Venturis only.

CAUTION

Only compatible products can be injected through the dual dosing channel. There are fertilizer combinations that should **never** be used in the dual dosing channel as they will induce crystallization and cause clogging of the pipes.

Fertilizer combinations prone to induce crystallization:

		•	,	
Calcium Nitrate	+	Ammonium Sulfate	⇒	Calcium Sulfate
Calcium Nitrate	+	Potassium Sulfate	⇒	Calcium Sulfate
MKP	+	Calcium Nitrate	⇒	Calcium Phosphate
MAP	+	Calcium Nitrate	⇒	Calcium Phosphate
Phosphoric acid	+	Calcium Nitrate	⇒	Calcium Phosphate

In case of doubt regarding the use of any combination of fertilizers in the dual dosing channel, contact your Netafim™ local representative.

→ MAINTENANCE

CAUTION

When opening or closing any manual valve, always do it gradually, to prevent damage to the system by water hammer.

To prevent failures and extend the life cycle of the FertiKit™, the user must carry out regular maintenance.

Keep the FertiKit[™] dosing unit and its immediate environment clean and dry.

CAUTION

Before calibrating the EC and pH sensors, gradually close the isolation valves and open the sampling valve until the pressure in the system is released.

• The FertiKit[™] dosing unit and the supply water and irrigation system must be inspected regularly.

Regular inspection

Description	How often	Instructions
Rinsing of fertilizer filters*	Once a day	
Rinsing of supply water filters*	Once a day	
Water and fertilizer leak inspection	Once a week	Visual inspection
Calibration of the pH sensor	Every 2-4 weeks	See the enclosed
Calibration of the EC sensor	Every 4 weeks	EC/pH Transmitter Manual

^{*} Manual filters only.

Check the FertiKit™ hydraulic conditions every 4 weeks

Consult the main line flow meter and pressure gauge, the upper manifold and lower manifold pressure gauges and the Rotameters of the dosing channels, fill in the data on the FertiKitTM Hydraulic Conditions Checklist on page 45 and make sure that all the hydraulic conditions match the reference data.

When verifying the flow rate for each dosing channel, make sure the cursors on all the Rotameters are adjusted.

NOTE

The Rotameter's scale is calibrated by the manufacturer for measurement of the flow rate of water (H_2O). Certain inacuracies may be observed when the flow rate of liquids with different densities, such as fertilizers and acids, is measured.

ATTENTION

Once a month, read the measured flow rates of the dosing channels and compare them with the flow rates defined in the controller, to check whether any changes have occurred.

→ WINTERIZATION

When opening or closing any manual valve, always do it gradually, to prevent damage to the system by water hammer.

If the system is not required for irrigation during the winter (mainly in open field applications) perform the following procedure to avoid damage caused by freezing when the FertiKit™ is idle for the winter period:

At the beginning of winter:

- Gradually close the isolation valves and open the sampling valve until the pressure in the system is released.
- Remove EC and pH sensors and store the pH sensor immersed in KCL solution (supplied with the sensor) or in calibration buffer 4 at temperature 18-25°C (64-77°F). The pH sensor must never be dry (see the enclosed EC/pH Transmitter User Manual).
- Empty the FertiKit[™] of water.

At the end of winter:

- Reinstall the EC and pH sensors and calibrate them (see the enclosed EC/pH Transmitter User Manual).
- Gradually open the isolation valves until the pressure in the system is restored.

TROUBLESHOOTING

This chapter is a systematic guide to the actions to be taken in the case of a malfunction of the FertiKit™.

ATTENTION

Before proceeding to troubleshoot any malfunction, make sure that:

- The controller settings regarding the dosing channels are correct and match the dosing channels
 of the FertiKit™ (see the Controller Manual).
- The controller settings regarding the field valves are correct (see the enclosed Controller User Manual).
- Perform the actions in their order of appearance until the malfunction is fixed.
 If you identify faulty parts consult your Netafim™ representative.

WARNING

Only qualified electricians are permitted to perform electrical installations and repairs!

CAUTION

CAUTIONIf isolation valves have been installed on the system, ensure that they are in closed position before troubleshooting any hydraulic malfunction.

ATTENTION

If fertilizers from a different manufacturer have been recently in use and changes in EC and pH are recorded, perform calibration of the system before assuming a malfunction of the FertiKit $^{\text{TM}}$ (see Appendix 1 - Calibration, page 25).

→ SYMPTOMS REGARDING MORE THAN ONE SINGLE DOSING CHANNEL

If one or more of the following symptoms occur regarding more than one single dosing channel, perform the actions listed bellow:

Controller warnings

- Low EC
- High pH
- Low fertilizer/acid flow rate

Rotameter reading

Low fertilizer/acid flow rate

Action

- **1.** For controller warnings only check and calibrate the EC and pH sensors (see the enclosed EC/pH Transmitter User Manual).
- 2. Have a qualified electrician check that electricity is being supplied to the FertiKit[™] and that all the electrical components are properly connected (see the enclosed Switchboard electrical diagram).
- **3.** Check that the hydraulic conditions comply with the reference data in the FertiKit™ Hydraulic Conditions Checklist on page 45.

If NO, restore the original hydraulic conditions according to the reference data in the FertiKit™ Hydraulic Conditions Checklist on page 45.

If YES or if the malfunction is still not fixed after restoring the original hydraulic conditions, in PL or PB mode - have a qualified electrician check the dosing booster:

Does it function? Does it rotate in the correct direction?

If not - the electrician should swap between phases L1 and L3 (see the enclosed Dosing Booster Manual).

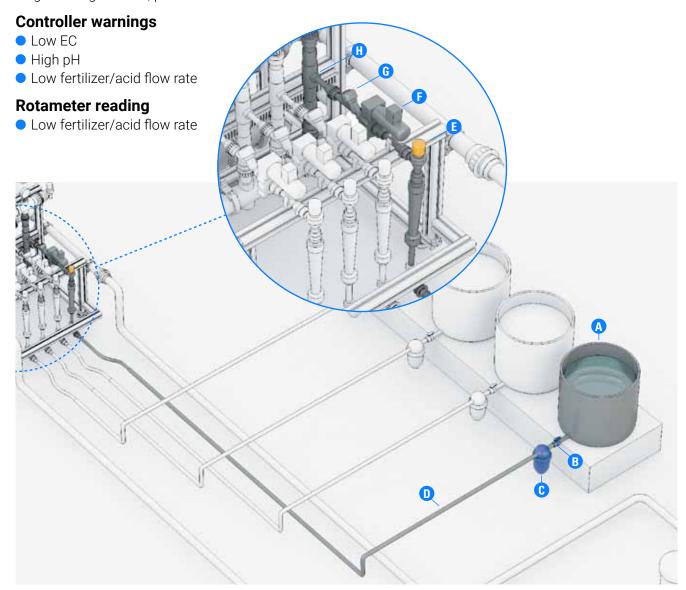

- **4.** Check for an air pocket in the dosing booster impeller chamber (see the enclosed Dosing Booster Manual): Open the FertiKit™ sampling valve until a stable flow, free of air-bubbles, is obtained.
- **5.** If the original hydraulic conditions are still not restored loosen the dosing booster's bleeding screw and wait until a stable flow, free of air-bubbles, is obtained, then retighten the bleeding screw (see the enclosed Dosing Booster Manual).
- **6.** Check the dosing booster's impeller chamber for clogging:

 If it is clogged it should be dismantled and thoroughly cleaned (see the enclosed Dosing Booster Manual).

If after implementing all the above steps the malfunction is still not fixed - consult your Netafim™ representative.

→ SYMPTOMS REGARDING A SINGLE DOSING CHANNEL

If one or more of the following symptoms occur regarding a single dosing channel, perform the actions listed bellow:

Action

- 1. Check that there is fertilizer/acid solution in the stock tank (A).
- 2. Check that the stock tank manual valve B is in the OPEN position.
- **3.** Check that the fertilizer/acid filter **C** is clean If not, it should be dismantled and thoroughly cleaned.

- **4.** Check the fertilizer/acid line **D** (from the stock tank to the dosing channel) for leaks and breaches and make sure all the connectors are tightened.
- **5.** Make sure the dosing channel's needle valve **E** is open according to the reference data in the FertiKit™ Hydraulic Conditions Checklist on page 45.
- **6.** Visually check the needle valve **E** for chemical damage (internal deformation). If internal deformation is present replace the needle valve.
- 7. Visually check the needle valve **E** for clogging.

 If clogging is present thoroughly clean the needle valve.
- **8.** Check that the dosing valve **F** is functioning:

With the controller in MANUAL mode, set the dosing valve **(F)** to ON (see the enclosed Controller Manual). The LED on the dosing valve should be lit.

If it is not - have a qualified electrician check the dosing valve's cable for electrical continuity.

If the cable is in working order - check the controller (see the enclosed Controller Manual).

If the controller and the cable are in working order - toggle the dosing valve \bigcirc to OFF and again to ON in the controller (see the enclosed Controller Manual). A "Click" should be heard from the dosing valve with each toggle - If a "Click" is not heard, replace the dosing valve (consult your NetafimTM representative).

If a "Click" is heard and the dosing valve **5** still does not open - disconnect the dosing valve from the dosing channel and with the dosing valve set to ON in the controller (see the enclosed Controller Manual), check for clogging by injecting water at low pressure through the dosing valve.

If there is clogging - thoroughly clean the dosing valve **F** with running water.

If there is no clogging and the dosing valve **F** still does not open - replace it (consult your Netafim™ representative).

- **9.** Visually check the non-return valve **G** for any internal deformation or damage to its flat ring gasket. If present replace the non-return valve (consult your Netafim™ representative).
- **10.** Check the non-return valve **G** for clogging by injecting water at low pressure through it (make sure to respect the direction of flow).

If there is clogging - thoroughly clean the non-return valve **G** with running water.

11. Disconnect the Venturi from the manifolds and from the dosing channel and check it for clogging, visually and by injecting water at low pressure through it.

If there is clogging - thoroughly clean the Venturi (H) with running water.

If after implementing all the above steps the malfunction is still not fixed - consult your Netafim™ representative.

→ SYMPTOMS WHILE IDLE

If the following symptoms occur while the FertiKit[™] is idle, perform the actions listed bellow:

Controller warnings

- Low EC
- High pH
- While idle Uncontrolled fertilizer/acid flow rate or a fertilizer/acid leak or breach

Action

NOTE

When using a dosing valve with manual override (model: Fip S12 or S22), make sure the dosing valve selector is in the CLOSED position.

Check if the dosing valves leak when closed:

- 1. Close all the manual valves B for fertilizers and acid.
- **2.** Make sure the level of the solution in all the stock tanks is higher than the dosing valves.
- **3.** With the controller in MANUAL mode, set all the dosing valves to OFF (see the enclosed Controller Manual).
- **4.** Disconect one of the the dosing valves from the non-return valve (downstream from the dosing valve).
- **5.** Open the fertilizer manual valve **B**.

 If a leak from the dosing valve is visible disconect the dosing valve from the dosing channel.
- **6.** With the controller in MANUAL mode, set the dosing valve to ON (see the enclosed Controller Manual).
- 7. Thoroughly clean the dosing valve with running water.
- **8.** Repeat steps 4-7 for each fertilizer and acid dosing channel.
- 9. After completing the procedure, open all the manual valves B for fertilizers and acid.
- 10. If the malfunction is still not fixed replace the dosing valve.

If after implementing all the above steps the malfunction is still not fixed - consult your Netafim[™] representative.

→ SWITCHBOARD WARNING

If the following symptom occurs during operation, perform the actions listed bellow:

Switchboard warning light

The switchboard warning light is on (When the dosing booster is either ON or OFF).

Action

1. Check if the pressure on the main line is low compared with the reference data on the FertiKit™ Hydraulic Conditions Checklist on page 45:

If YES, restore the original main line pressure.

2. Check if the overload protection breaker is ON (see the enclosed Switchboard Manual). Toggle it OFF and ON again.

If the switchboard warning light is still on or the overload protection breaker trips (turns to OFF) again, have a qualified electrician check if the dosing booster is in working order (see the enclosed Dosing Booster Manual) and check if there are irregularities in the electricity voltage supplied to the FertiKit $^{\text{TM}}$.

If after implementing all the above steps the malfunction is still not fixed - consult your Netafim™ representative.

CALIBRATION

The process of calibrating the FertiKit™ is carried out in three stages:

→ 1. CALCULATION OF DOSING CHANNELS OPENING PERCENTAGE

To finely calibrate the FertiKit™ in order to achieve homogeneous and stable dosing, perform the following calculation for each dosing channel (fertilizers and acid) to determine the amount of suction reduction needed to attain the required fertilizer/acid flow rate.

Metric units

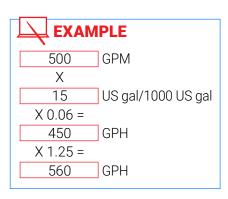

Flow rate of the largest irrigation shift XDosing ratio of a single fertilizer/acid I/m^3 =

Result: a single fertilizer flow rate I/h X = I/h X = I/h X = I/h X = I/h

Definition	
Dosing ratio =	The quantity of fertilizer/acid (I)
	1 m ³ irrigation water

US units

Flow rate of the largest irrigation shift XDosing ratio of a single fertilizer/acid XUS gal/1000 US gal X 0.06 = **Result:** a single fertilizer flow rate X 1.25 = **Result:** target Rotameter reading X

EXAMPLE

m³/h

 I/m^3

l/h

l/h

120

Χ

3

360

X 1.25 =

450

Definition Dosing ratio = The quantity of fertilizer/acid (US gal) 1 THG (1000 US gal) irrigation water

NOTE

The Rotameter's scale is calibrated by the manufacturer for measurement of the flow rate of water (H_2O). Certain inacuracies may be observed when the flow rate of liquids with different densities, such as fertilizers and acids, is measured.

ightarrow 2. SIMULATION TEST WITH A 10 LITER (2 US GAL) BUCKET OF WATER

Instruments needed

- Good-quality portable EC and pH sensors, finely calibrated
- Calibration solutions for EC and pH
- Bucket with a scale for up to 10 liters (2 US gallons)
- Measuring tube or syringe with a scale for up to 100 cc (1 oz)
- Clean (preferably distilled) water for cleaning sensors during calibration
- Blotting paper for cleaning and drying

• The client prepares the fertilizer solutions and the acid solution (if required) in the stock tanks according to the recipe advised by the agronomist/consultant.

ATTENTION

Restore the settings of all the alarms back to the state where adequate protection to the system and the crop is provided (see the enclosed Controller Manual).

- Note the required dosing ratio of each fertilizer solution and the dosing ratio of the acid solution (if used).
- Fill a bucket with 10 liters (2 US gallons) of the client's supply water (without fertilizer or acid).
- Measure the EC and the pH levels of the water in the bucket using calibrated portable sensors.

EXAMPLE

•	EC	pН
Supply water (without fertilizer or acid)	0.3	7.8

• Using a measuring tube or a syringe, take a dose from each fertilizer solution and from the acid solution (if used) according to the proportions determined by the dosing ratio (see example below) and mix thoroughly with the water in the bucket.

Metric units

For a fertilizers dosing ratio of 5 l/m³ each and an acid dosing ratio of 2 l/m³, the quantities for 10 liters of water in the Bucket-simulation-test will be 50 cc of each fertilizer solution and 20 cc of the acid solution.

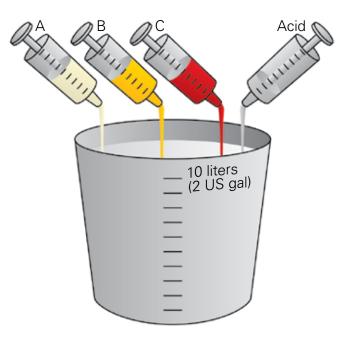

For a fertilizers dosing ratio of 1.5 US gal/THG each and an acid dosing ratio of 1.1 US gal/THG the quantities for 2 US gallons of water in the Bucket-simulation-test will be 0.38 oz* of each fertilizer solution and 0.28 oz** of the acid solution.

*
$$\frac{1.5 \times 2}{1000}$$
 = 0.003 US gal = 0.384 oz

**
$$\frac{1.1 \times 2}{1000}$$
 = 0.0022 US gal = 0.28 oz

- Measure the EC and the pH levels of the mixture in the bucket using calibrated portable sensors.
- Compare the measured EC and pH values to the target values set by the agronomist/consultant.

	EC	рН
After adding the fertilizers and acid	1.6	5.5
Target values	1.8	5.8
Deviation from target value	11%	5%

- With the controller set to operate according to EC/pH values if the EC and pH values measured in the bucket are within a range of ±30% deviation from the target values, the system will be able to correct them automatically.
- If the values are out of the ±30% range, check the data and consult the agronomist/consultant.

→ 3. CALIBRATION OF THE FERTIKIT™ WHILE IRRIGATING

WARNING

Extreme EC or pH values may damage the crop.

Perform the following procedure only after completing stage 2 above (Simulation test with a 10 liter or 2 US gallon bucket of water) with satisfactory results.

The following steps explain the operations to be performed, regardless of the type of controller used. For the operation of your controller's interface (see the Controller user manual).

However, since the GrowSphere MAX controller is widely used - its interface screens for the execution of each step are noted. If the GrowSphere MAX is your controller, perform the calibration process with the enclosed controller user manual in hand.

NOTE

Before the calibration, confirm that the EC and the pH sensors of the FertiKit[™] have been calibrated according to the instructions in the enclosed EC/pH transmeter Manual.

- Set the dosing mode to SPREAD (GrowSphere MAX IPK).
- Enter the data for the irrigation valves (GrowSphere MAX 00).
- Enter the dosing ratio for each dosing channel (GrowSphere MAX [NPK]).
- Run the program (GrowSphere MAX ₀⁰).
- Allow a few minutes for the pipes to fill up and the flow rate to stabilize.
- Reduce the suction of the dosing channels by adjusting the manual needle valve of each dosing channel until the "target Rotameter reading" calculated in stage 1 (page 38) is attained.

NOTE

The Rotameter's scale is calibrated by the manufacturer for measurement of the flow rate of water (H_2O) . Certain inacuracies may be observed when the flow rate of liquids with different densities, such as fertilizers and acids, is measured.

- Check the appropriate controller screen for the measured EC and pH values (GrowSphere MAX 給).
 If the desired values have been reached, check opening percentages of the dosing valves.
- The EC and pH target values should be attained with the dosing valves opened to 50% 80% of their capacity.
- If the EC and pH target values are attained with the dosing valves opened less than 50%, reduce the dosing channel suction rate, until the EC and pH target values are reached.

NOTE

Every change in the flow rate of the needle valve must be updated afterwards in the controller (**GrowSphere MAX -** PFK).

- If the EC and pH target values cannot be attained, and the dosing valves are opened more than 85%, measures should be taken to increase the dosing ratio if feasible, slightly increase the concentration of the fertilizer solution and/or reduce the water flow rate to the field during irrigation.

 If not consult the agronomist/consultant.
- In a field where the flow rate changes significantly from one irrigation shift to the next, try to be at a minimum of 50% dosing valve opening for the low flow rate shift, and a maximum of 80% for the high flow rate shift.
- When the calibration process is complete, set the dosing mode to 1/1000 (GrowSphere MAX [PK]).
- In the EC and pH alarm definitions, define the EC and pH deviation from the target values that, if attained, will trigger the alarm and set the EC and pH alarm to the ON position (activated) (GrowSphere MAX ⚠).

NOTE

EC and pH values must not exceed a ±30% deviation from the target values.

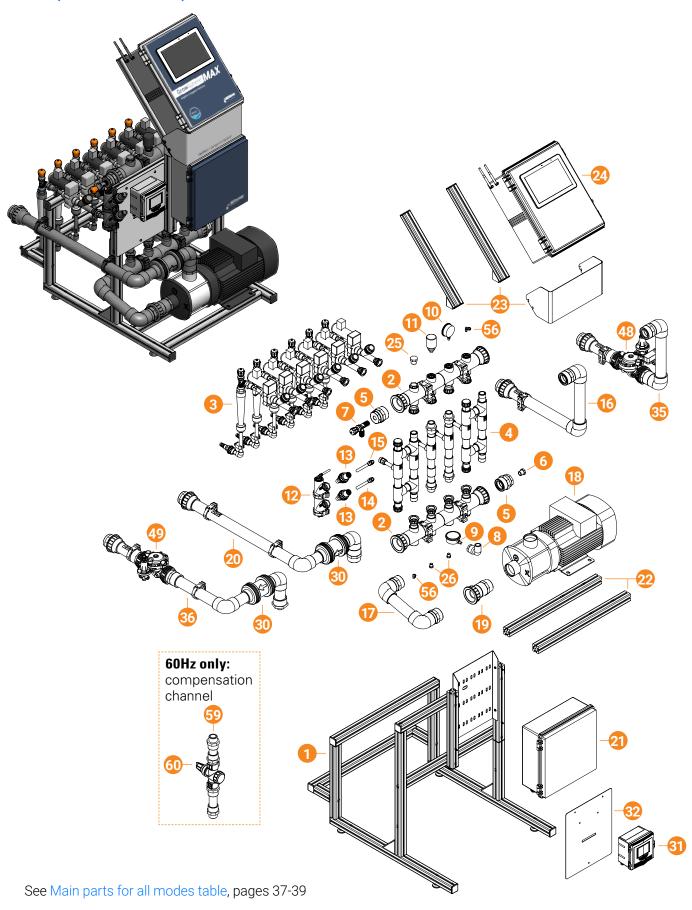

ATTENTION

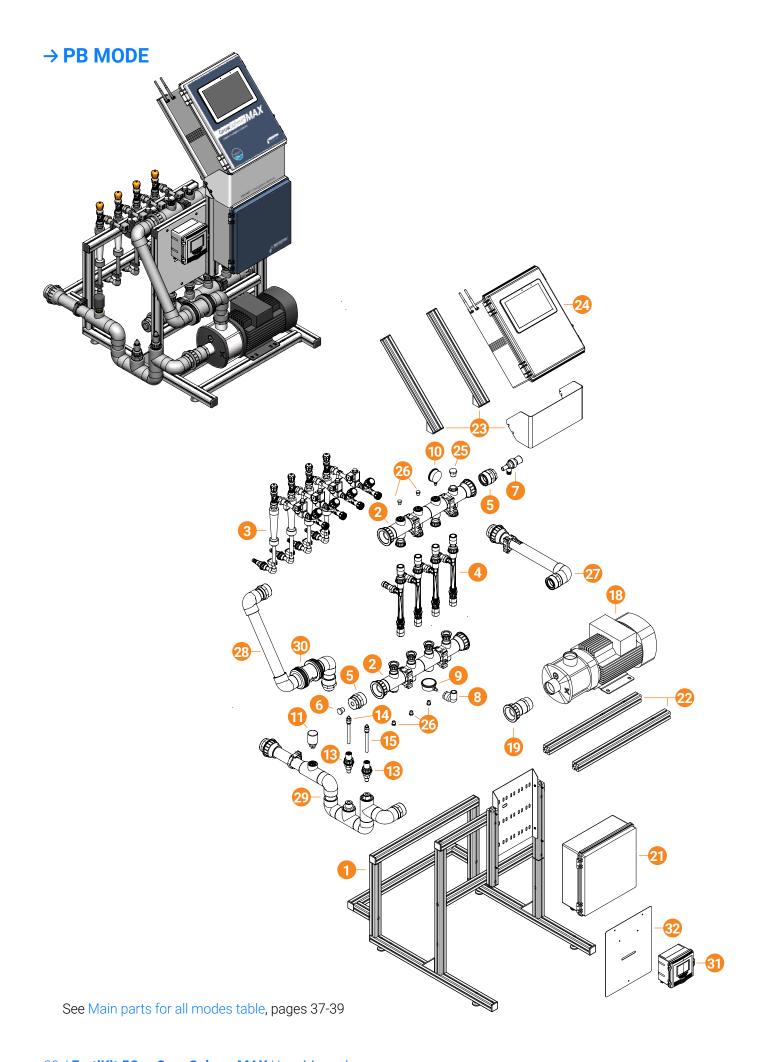

Once a month, read the measured flow rates of the dosing channels and compare them with the flow rates defined in the controller, in order to check whether changes have occurred **(GrowSphere MAX - - (MPK))**.

After completing the calibration process, fill out the FertiKit™ Hydraulic Conditions Checklist (page 45)
in three copies. Make sure to fill out all the boxes.

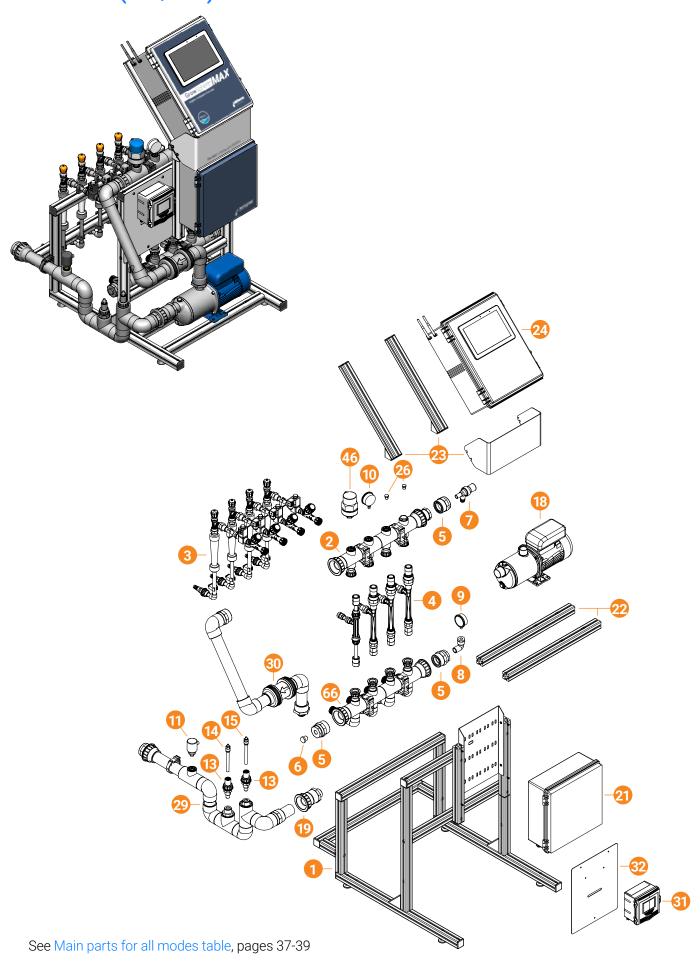

LIST OF PARTS

→ PL (PL/PS/PR/RL) MODES

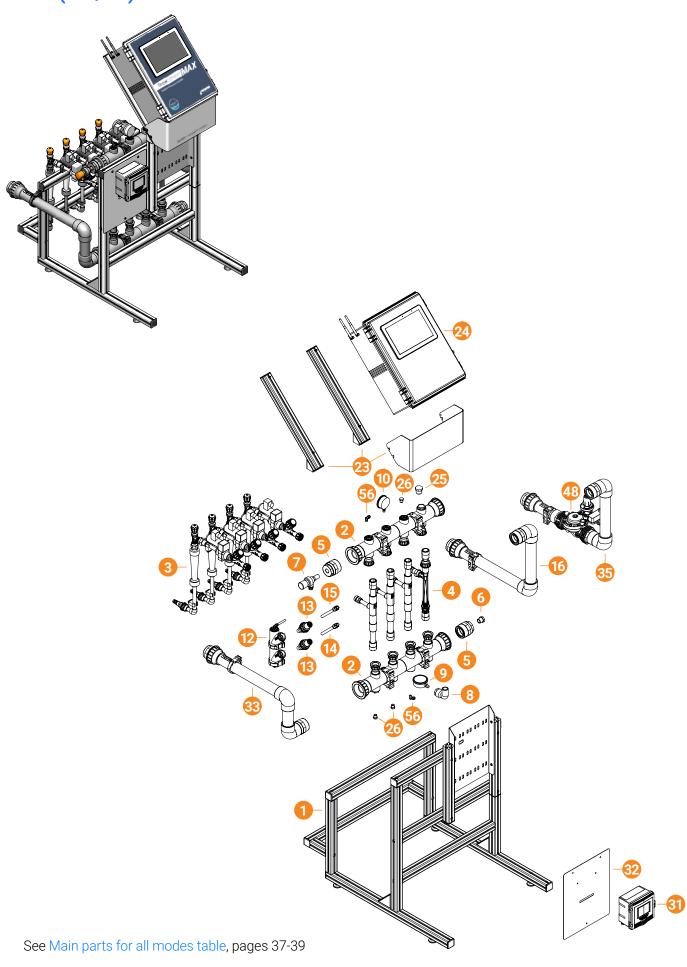

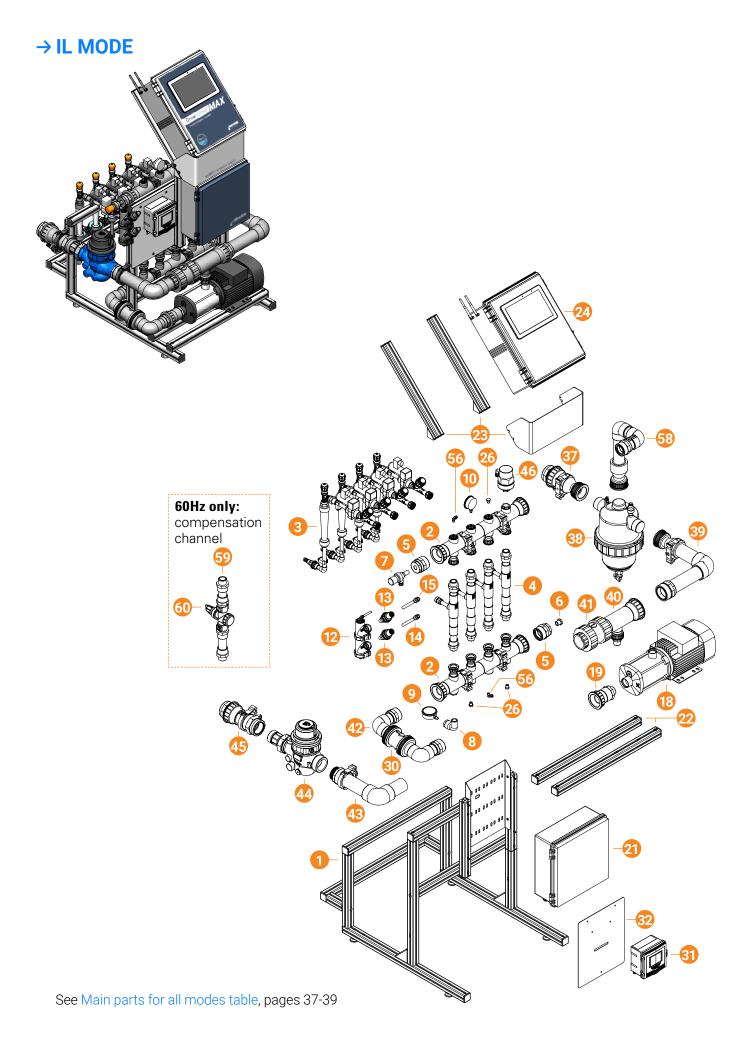

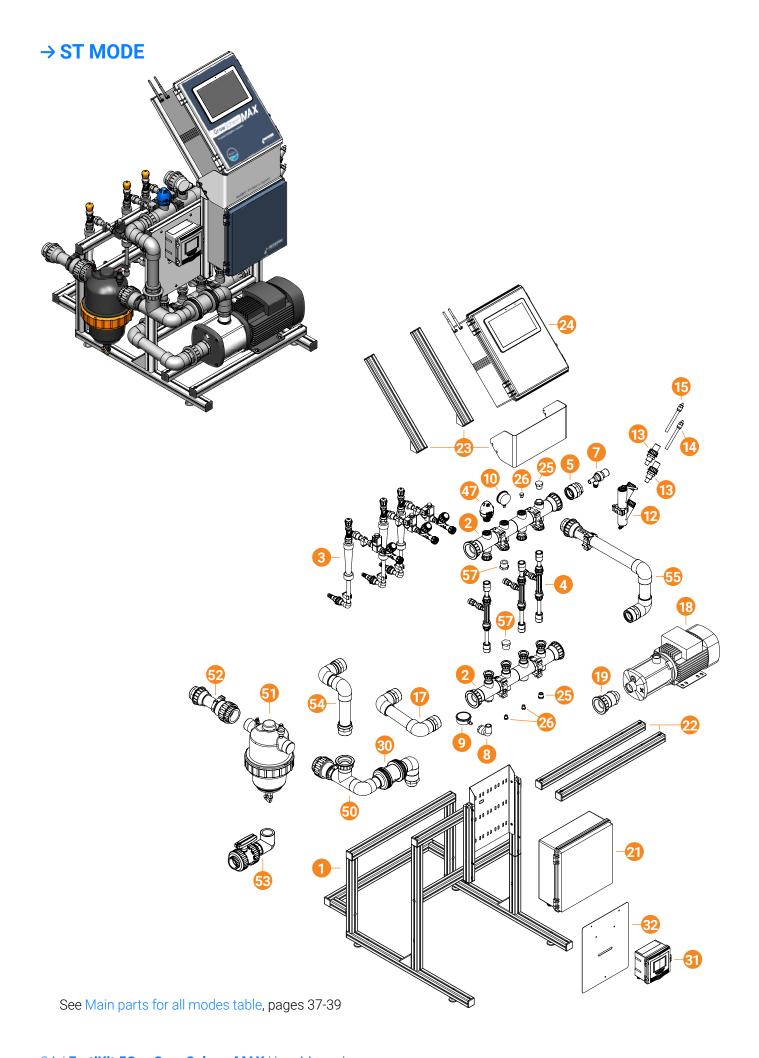

→ SP MODE (mm/inch)

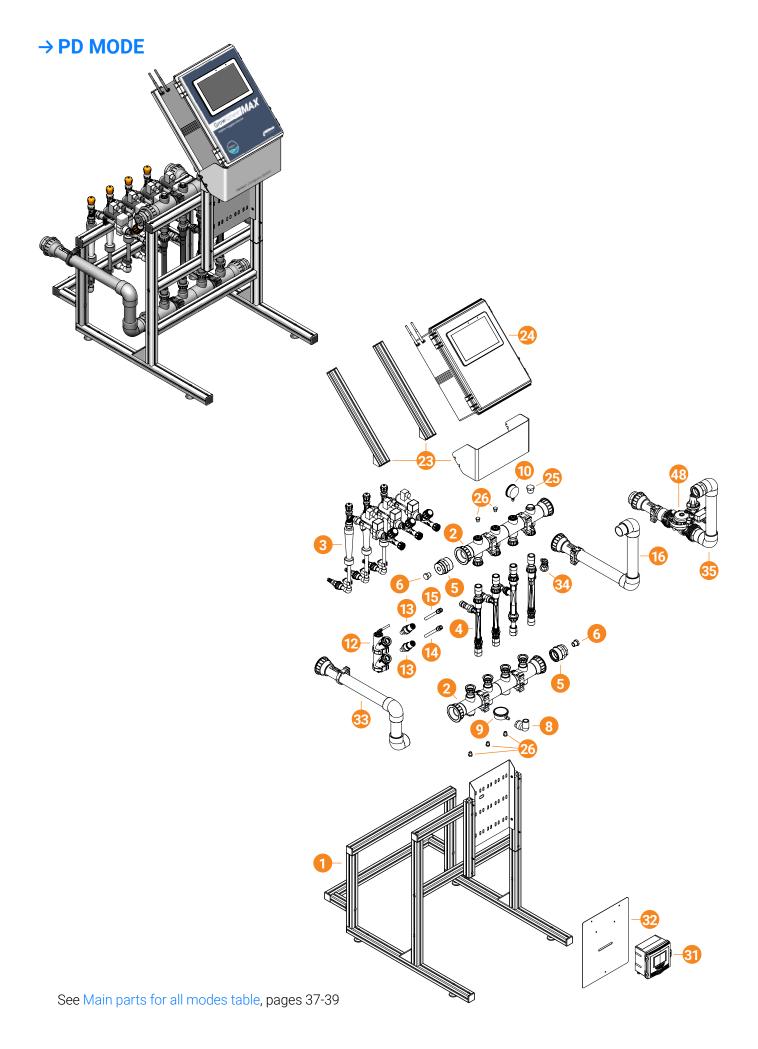

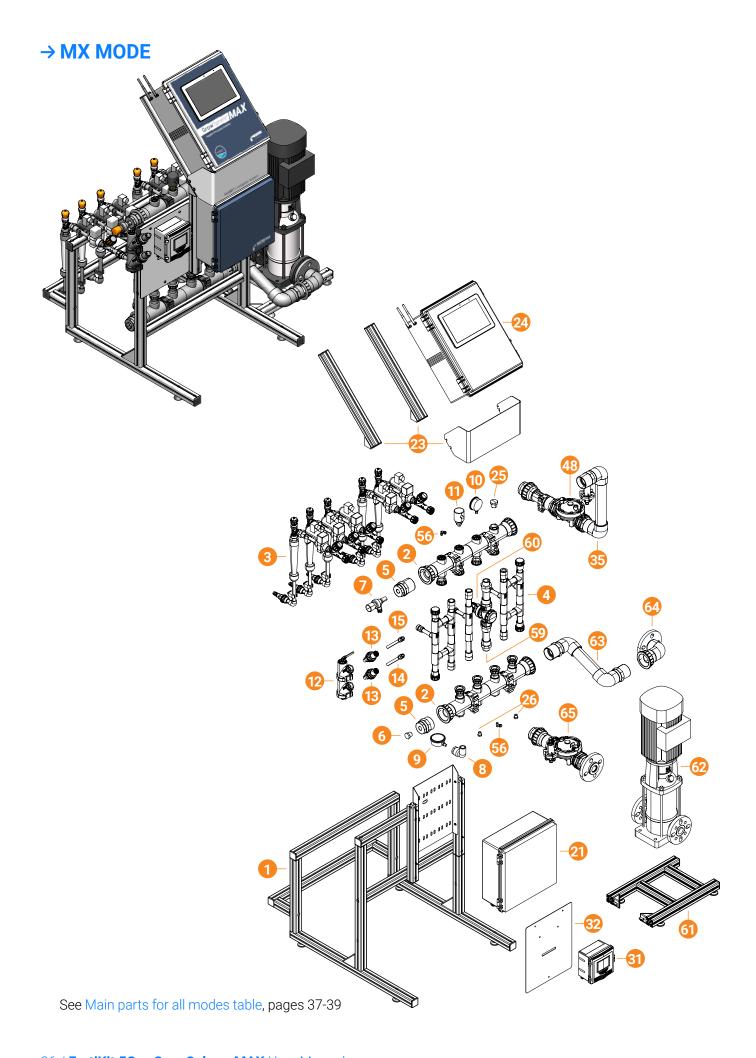

→ MS (MS/RS) MODES

HYDRAULIC CONDITION CHECKLIST

Consult the main line flow meter and pressure gauge, the upper manifold and lower manifold pressure gauges and make sure all the hydraulic conditions are in range according to the following table (see the enclosed Installation Manual, page 29):

Serial number	
Project name	
Technician name	
Installation date	
Notes	

Mode	Main line	Upper manifold	Lower manifold		
PD	Pressure upstream from the PRV \leq +8 bar (+116 PSI) and \geq X2 the pressure downstream from the PRV (make sure there is suficient pressure for the field requirements)		2 the pressure in the		
PL, MX	+2.5 - +6.5 bar (+36 - +94 PSI)	= the pressure on the main line	-0.3 - +0.8 bar (-4 - +12 PSI)*		
РВ	+1 - +2.5 bar (+14 - +36 PSI)	+4 - +6.5 bar (+58 - +94 PSI)	+1 - +2.5 bar (+14 - +36 PSI)		
MS	The main line pump is able to deliver the flow rate required for the operation of the FertKit™ + the field consumption. Pressure upstream from the main line pump < +0.5 bar (+7 PSI). Pressure at the outlet of the main line pump < +7 bar (+101 PSI).	= the pressure at the outlet of main line pump	-0.3 - +0.3 bar (-4 - +4 PSI)		

^{*}For system installed at an elevation up to 500 m (1,640 ft) above sea level. If your system is at an elevation higher than 500 m (1,640 ft) above sea level, consult your local Netafim™ representative.

WARRANTY

NetafimTM warrants all the components of the FertiKitTM to be free of defects in material and workmanship for 1 (one) year from the date of installation, provided the installation has been reported to NetafimTM within 30 days of installation.

If the installation was not reported or was reported later than 30 days from the date of installation, Netafim™ will warrant the FertiKit™ for a period of 18 months from the date of production, according to its serial number.

If a defect is discovered during the applicable warranty period, NetafimTM will repair or replace, at its discretion, the product or the defective part.

The above does not apply to EC and pH sensors, since they are considered perishable items. NetafimTM will warrant these items to be free of defects in material and workmanship for 3 months from the date of installation, provided the installation has been reported to NetafimTM within 30 days, or 6 months from date of production if installation was not reported or was reported later than 30 days from the date of installation.

NOTE

When not installed, the pH sensor must be immersed in KCL solution (pH \approx 4.0) at all time, protected from freezing and not be exposed to pressure greater than 6 bars (87 PSI). Damage due to these causes is not covered by warranty.

This warranty does not extend to repairs, adjustments or replacements of a FertiKit™ or part that results from misuse, negligence, alteration, force majeure, lightning, power surge, improper installation or improper maintenance.

If a defect arises in your Netafim[™] product during the warranty period, contact your Netafim[™] supplier.

Limited Warranty

This warranty is subject to the conditions in Netafim's official warranty statement. (For the full text of Netafim's official warranty statement, please contact Netafim TM).

APPENDIX

→ DOSING RATIO ESTIMATES

These are only estimates - for the exact fertilizer dosing ratio in a given project, consult an agronomist.

Irrigation according to the water consumption of the crop

Стор	Dosing ratio per channel (I/m³) (US gal/1000 US gal)			
Open Field	Type 1	Type 2		
Carrot	1	2.5		
Corn / Maize	2	5		
Cotton	2	5		
Flowers	3	5		
Industrial tomato	1	2.5		
Onion	2	5		
Plantations (Tea, coffee, citrus, avocado, almonds, pecan nuts)	1	2.5		
Potato	1	2.5		
Sorghum	1	2.5		
Sugar cane	1.5	3		
Vegetables	3	5		
Watermelon	1	2.5		

Protected Crops (greenhouse)	
Vegetable in soil (A+B+acid)	5
Flowers in soil (A+B+acid)	5
Vegetable in soil (A+B+C+D+acid)	3.5
Flowers in soil (A+B+C+D+acid)	3.5
Vegetable in substrate	5
Flowers in substrate	5
Vegetable in substrate (High-Tech greenhouse - Multi-pulse**)	10
Flowers in substrate (High-Tech greenhouse - Multi-pulse**)	10

Type 1: Normal irrigation/nutrigation - Usually out of the rainy season, where a lower fertilizer dosing ratio is required

Type 2: Technical Nutrigation - Usually during rainy seasons, where a small quantity of irrigation water is required for application of the fertilizer.
